

# ROK Solution and the industrial sector

A solution that responds to management problems in project mode, lists the methods of operation, shares and monitors the production process, collects data on your carbon consumption with minimal effort from settings and change management.

Methods of operation and production

Layout and launch

**How to ensure that the methods of operation are correctly listed and shared? How to adapt and share the production, manufacturing, assembly, etc. processes in real time ?**

ROK Solution is a solution based on **capitalizing on and securely sharing repositories** of procedures (production processes, methods of operation) and EDM (tech. repositories, manuals, etc.). You can **change the repository process in just a few clicks**. **The production processes can be instantiated and monitored by workflow at any time.**

**How to work in project mode, plan and monitor this project with suppliers and subcontractors ?**

In just a few clicks, you can create a **project organizational chart** on the web, **share it with your ecosystem** and monitor your delivery processes through workflow and alerts. The stages of the project may be subject to review and secure storage of **records and receipts**. As a collaborative platform, ROK Solution allows you to organize a **conf call with your partners at any time.**

## QSE standards

**How to maintain repository on Quality, Safety, and Environmental standards? How to ensure that it is updated and shared with employees and that the processes limiting risks are taken into account ?**

ROK Solution is a Knowledge Management solution that ensures information is made available to employees. **All updates are immediate, secure, and indisputable.** The **standards are accessible** at any time in the relevant format.

## Carbon Footprint

**Measuring the carbon footprint in keeping with ADEME standards is a true calling. Implementing the improvement processes can be laborious without the right tool. Monitoring the footprint and improvements is exhausting.**

ROK Solution can host the **ADEME spreadsheets**, send them to targeted services, **consolidate results**, and gather the supporting documents in the associated EDM at the same time. The **process can be monitored** by workflow (planning and alerts). The progress at each stage can be discussed via direct conf. call with ROK Solution.

## Change management

The existing maps are easily capitalized in ROK. Information may be **shared in the most appropriate format.** No IT architecture to implement, no real training envisaged for the various project actors. Implementation is **immediate**, access to the information may be authorized by ROK Page in the most appropriate format.
