

# Modeling with ROK Solution

Three good reasons to develop models with ROK Solution :

Deploy the solution in record time

ROK Solution is a Cloud Solution: no impact on the IT master plan or maximum elasticity and agility. ROK Solution has a SaaS billing model: no investment costs - just a monthly subscription and the option of terminating the contract at any time (TCO = subscription). Settings are intuitive: the organizational settings are established through the Excel interfaces implementable by a non-expert user.

Developing a model with ROK is extremely easy

**ROK Solution has a user-friendly interface** that uses any existing format for development in three simple stages. It's possible to start the modeling with a **simplified mapping** (global functioning analysis). **Online repositories** in the ROK Store are importable and executable through the ROK platform.

Share an operational data repository in real time without change management

**Mapping process is actively linked to the organization** and made available to the user in a customized format (Intranet, email, web, etc.). The access is transparent for the end user.
