ROK Solution – your change management tool that is integrated with the operational repository, that generates automatic alerts, and where updated information is always available.

Updated organizational chart

Finding an updated organizational chart with the most recent arrivals/departures of and changes to personnel is a rarely guaranteed prerequisite for any repository sharing.

ROK is a BPM solution that manages business, repository, social, and project organizational charts.

As an external model, it can analyze the gap between the organization in ROK, the IS directory and/or the payment application, thereby guaranteeing the integrity of the data.

Any change is immediately reflected.

Assured shared repositories

How to ensure that the modeled repositories are sent to the appropriate persons and that simple and customized access is available to them at all times ?

ROK is a collaborative Intranet. The integrity of the organizational chart, processes, EDM, and IS guarantees the accuracy of the information.
Its web interface and integration with messaging and/or company Intranet guarantee that the information will be stored in the best place.

Updated process mapping

How to ensure that the modeled processes at any given moment are sent individually to the persons in question ?

The processes are assigned according to positions, which are assigned to employees. The user receives an alert (email, Intranet, etc.) of any process change in real time. The EDM and IT rights are constantly updated.

A quality answer/ISO

How to make the effort for certification, but not sure that the information is well understood without reproduce the day before the annual audit and without difficulty justifying areas of improvement ?
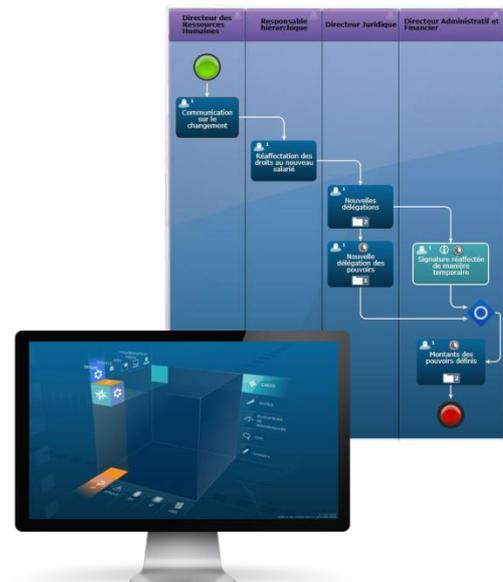

Modeling in ROK is ISO. Records are preserved (versioning). The recipient will only see information relevant to him and there's no need to go search for it. The model "sticks" to reality and the process may be viewed either in flow chart or task sheet format.

Organizational Agility

Manage the migration of an ERP – updating an IT tool or acquiring a new application is a real nightmare as regards costs, time of implementation, team mobilization, training, and, more generally, change management.

ROK makes it possible to create ad hoc project teams. ROK measures in real time the impact on skills, processes, risks. ROK creates an Intranet project similar to the organization that is equipped with the most sophisticated communications tools (including external partners). ROK is the basis for the training and for the adoption of the new solution.

Change Management

The implementation is carried out by web service and/or a simple Excel import. Updates are made graphically from the organizational chart. The information is sent through ROK in real time, or simply by email (automatic) or your company Intranet. Zero effort: ROK is updated with real-time alerts and the ROK Pages "host" the information in the most appropriate format (Intranet, email, etc.). Useful information is sent to its recipient via the desired format. Updates generate alerts. Inside ROK: the project, monitoring, and impacts are managed in real time in the desired format, in the company and with its ecosystem (consulting firms, integrators, etc.)
