

Performing with ROK Solution

ROK is a BPM/BAM integrated solution facilitating real-time monitoring of your organization's performance and providing appropriate corrections.

Managing orphaned tasks

How to ensure that you are integrated with the updated employee database, and that the roles are all correctly assigned as the organization changes ? How to manage access to EDM and IS and fix potential anomalies ?

ROK automatically sends an alert for anything that could resemble an anomaly : employee database not integrated with the HRIS and/or electronic directory, vacant position, integrity of IT rights modeled and rights assigned, new risks emerging following changes to the IS or organizational chart, etc.

Alerts and Gantt

How to ensure that processes are properly executed over time? How to be certain that all new information (new rates, methods, procedures, etc.) is properly disseminated ? How to measure performance and take corrective measures ?

If you want, any new action in ROK Solution can be accompanied by an **alert**. **All instantiated processes generate a Gantt and PERT chart**. You are immediately notified of the tasks to perform at that time. You can enter your actual time and analyze your organization's performance.

Control panel

80% of management spends more than 50% of their time reporting with Excel. This is approximate, very time consuming, redundant and has no added value.

ROK Solution allows you to automate any set of indicators you define, their concatenation, and report reproduction. This is managed through a workflow that you can easily model based on your current formats. The flow is managed, secured, and monitored by a Gantt chart.

A powerful BAM

How to recover information generated by your applications, without constantly asking your IT department? How to use this information to start the appropriate process ?

ROK Solution is an external workflow. It easily interfaces with your other applications (web services, bus. activities). ROK was developed in a Microsoft environment. It interfaces with Biztalk (a BAM/EAI Microsoft distributed to more than 11,000 clients worldwide).

Change Management

Its dynamic analyses are generated in real time and alerts are created automatically. **Its dynamic analyses** are generated in real time and alerts are created automatically. **Easy to implement, high-performance, and secure** - it requires no training. ROK's promise is founded on its ability to **make the workflow settings accessible and ergonomic to IT actors.**
